(54) Systems for playing games

(57) A system for playing a game comprises a control unit 3 connected to a plurality of play stations 5 by a bus 18. The play stations 5 are uncommitted programmable apparatuses, such as microprocessors having random access program memory, and a game program is supplied to the stations 5 by the control unit 3 prior to commencement of a game. Thus, the system can be set for any game, or can be arranged to play a different game, merely by supplying the appropriate program from the control unit and storing it in the program RAM in the play stations.
